

Business Insights & Recommendations

Project: E-Commerce Sales & Customer Analysis

This report presents the major business insights and data-driven recommendations obtained from the Power BI dashboard developed for the Brazilian e-commerce dataset. The analysis focuses on sales performance, customers, payment preferences, regional demand and monthly revenue trends.

Power BI Dashboard

E-Commerce Sales & Customer Analysis Power BI Dashboard

1. Key Business Insights

Insight 1: Overall Sales Performance

The e-commerce business generated approximately **13.59 million** in total revenue from around **99.44K orders**. This indicates a strong overall sales volume and a large transaction base. The revenue and order KPIs provide a useful high-level view of the business's overall performance.

Insight 2: Large Customer Base

The dashboard shows approximately **96.10K unique customers**. The presence of a large customer base indicates broad market reach. The difference between total orders and unique customers also suggests that some customers placed multiple orders, creating an opportunity to strengthen repeat-purchase and customer-retention strategies.

Insight 3: Credit Card is the Dominant Payment Method

Credit card payments represent approximately **78.34%** of the payment value shown in the dashboard. This makes credit cards the dominant payment method by a significant margin. Boleto, voucher and debit card payments contribute smaller shares of total payment value.

Insight 4: São Paulo is the Leading Customer State

Among the top customer states displayed in the dashboard, **São Paulo (SP)** has the highest contribution, at approximately **41K** customers/orders in the displayed ranking. Rio de Janeiro (RJ) and Minas Gerais (MG) follow. This indicates that the major southeastern states are important markets for the e-commerce business.

Insight 5: Monthly Revenue Shows Significant Variation

The monthly revenue trend shows noticeable changes throughout the year. Revenue reaches its highest visible level around **May**, at approximately **1.5M**, followed by fluctuations in subsequent months. A significant decline is visible around **September**, after which revenue improves again during October and November. This indicates an opportunity to better understand seasonal and monthly sales patterns.

2. Data-Driven Recommendations

Recommendation 1: Strengthen High-Performing Regions

The company should focus marketing, promotions and customer-service initiatives on high-performing states such as **São Paulo, Rio de Janeiro and Minas Gerais**. These regions already show strong demand and can be targeted with localized campaigns, customer-retention offers and improved delivery support. At the same time, targeted discounts can be used to develop lower-performing regions.

Recommendation 2: Improve Sales During Low-Performing Months

The business should investigate the reasons behind the significant revenue decline around **September**. Promotional campaigns, seasonal offers, targeted digital marketing and limited-time discounts can be planned before and during weaker months. Comparing product demand, customer activity and marketing performance across months can help improve revenue consistency.

3. Dashboard Metrics Summary

Metric	Dashboard Value / Observation
--------	-------------------------------

Total Orders	Approximately 99.44K
Total Customers	Approximately 96.10K
Total Revenue	Approximately 13.59M
Dominant Payment Method	Credit Card – approximately 78.34% of payment value
Leading Customer State	São Paulo (SP)
Highest Visible Monthly Revenue	Around May – approximately 1.5M

4. Conclusion

The Power BI dashboard provides a clear overview of the e-commerce business's sales performance, customer base, regional demand and payment preferences. The business has a strong order and customer base, while credit card payments and major southeastern states represent important parts of the current business activity. The monthly revenue trend also highlights fluctuations that should be investigated. By focusing on high-performing regions and applying targeted strategies during weaker months, the business can improve customer engagement, sales consistency and overall revenue performance.
